Instructions must be carefully followed. Reliability of assay results cannot be guaranteed if there are any deviations from these instructions.

**NAME**

Alinity s Chagas Reagent Kit

**Trypanosoma cruzi (E coli, Recombinant) Antigen**

**INTENDED USE**

The Alinity s Chagas assay is a chemiluminescent microparticle immunoassay (CMA) used for the qualitative detection of antibodies to *Trypanosoma cruzi* (the causative agent of Chagas disease) in human serum and plasma specimens on the Alinity s System. The Alinity s Chagas assay is intended to screen individual human donors, including volunteer donors of whole blood and blood components, and other living donors for the presence of antibodies to *Trypanosoma cruzi*. The assay is also intended for use in testing serum and plasma specimens to screen organ donors when specimens are obtained while the donor’s heart is still beating, and in testing serum specimens to screen cadaveric (non-heart-beating) donors. It is not intended for use on cord blood specimens.

**SUMMARY AND EXPLANATION OF THE TEST**

Chagas disease or American Trypanosomiasis is caused by the parasite *Trypanosoma cruzi* (*T. cruzi*).

It is estimated that 6 million to 7 million people globally have Chagas disease (most in Latin America). There are 3 morphologic forms in the life cycle of *T. cruzi*: epimastigote (multiplying form found in the midgut of insect vectors); amastigote (multiplying intracellular form in mammalian hosts); and trypomastigote (nondividing extracellular form in mammalian blood and insect feces). The majority of *T. cruzi* proteins are expressed in all 3 morphologic forms.

*Trypanosoma cruzi* is a species that is genetically heterogeneous and currently divided into 6 consensus groups (*T. cruzi* I-VI). Human infection of individuals in North, Central and South America (above the Amazon basin) is typically associated with the *T. cruzi* I lineage. Human infections in the Southern Cone of South America are commonly associated with the *T. cruzi* II, *T. cruzi* V, and *T. cruzi* VI lineages. Trypanosomiasis is primarily transmitted to humans by hematophagous triatomine insects. Other transmission modes include transfusion of blood products, organ transplantation, and congenital infection and oral ingestion of contaminated food. In the Americas, the vector-borne transmission route is still the prevailing means for new human infections.

Most infected persons, after a mild acute phase, enter the lifelong indeterminate phase that is characterized by a lack of symptoms, low parasitemia levels, and antibodies to a variety of *T. cruzi* antigens. Approximately 10% to 30% of persons with chronic *T. cruzi* infections, however, develop cardiac or gastrointestinal dysfunction as a consequence of the persistent presence of the parasite. The acute phase (which lasts approximately 2 months after infection) can be confirmed directly through observation of the presence of parasites or indirectly through the presence of IgM and IgG antibodies. In the chronic phase, parasites are usually rare, and laboratory diagnosis relies mainly on serological tests. Antibodies are present in more than 98% of infected individuals.

The Alinity s Chagas assay is based on recombinant proteins FP3, FP6, FP10, and TcF. In aggregate, these 4 hybrid recombinant proteins represent at least 14 distinct antigenic regions that broadly represent all 3 morphologic forms. Moreover, these recombinant proteins also contain antigens recognized by antibodies present in persons with acute *T. cruzi* infection as well as those with chronic Chagas disease. The epitopes represented by these proteins are used to detect antibodies to *T. cruzi* for blood screening and diagnostic applications.

**BIOLOGICAL PRINCIPLES OF THE PROCEDURE**

This assay is a two-step immunoassay for the qualitative detection of antibodies to *T. cruzi* in human serum and plasma using chemiluminescent microparticle immunoassay (CMA) technology. Sample, *T. cruzi* recombinant antigen (FP3, FP6, FP10, and TcF) coated paramagnetic microparticles and assay diluent, are combined and incubated. The antibodies to *T. cruzi* present in the sample bind to the recombinant antigen coated microparticles. The mixture is washed. Anti-human IgG acridinium-labeled conjugate is added to create a reaction mixture and incubated. Following a wash cycle, Pre-Trigger and Trigger Solutions are added.

The resulting chemiluminescent reaction is measured as relative light units (RLU). There is a direct relationship between the amount of antibodies to *T. cruzi* in the sample and the RLU detected by the system optics. The presence or absence of antibodies to *T. cruzi* in the sample is determined by comparing the chemiluminescent RLU in the reaction to the cutoff RLU determined from an active calibration.

For additional information on system and assay technology, refer to the Alinity s System Operations Manual, Section 3.

**REAGENTS**

**Warnings and Precautions**
- [IVD]
- For In Vitro Diagnostic Use
- Performance characteristics of this product have not been established for laboratory diagnosis of *T cruzi* infection.

**Safety Precautions**
**CAUTION:** This product requires the handling of human specimens. It is recommended that all source materials be considered potentially infectious and handled in accordance with the OSHA Standard on Bloodborne Pathogens. Biosafety Level 2 or other appropriate biohazard practices should be used for materials that contain or are suspected of containing infectious agents.\(^{10-13}\)

The following warnings and precautions apply to: **MICROPARTICLES / ASSAY DILUENT**

**WARNING**

- Contains methylisothiazolones.
- May cause an allergic skin reaction. H317

**Prevention**
- P261 Avoid breathing mist / vapors / spray.
- P272 Contaminated work clothing should not be allowed out of the workplace.
- P280 Wear protective gloves / protective clothing / eye protection.

**Response**
- P302+P352 IF ON SKIN: Wash with plenty of water.
- P333+P313 If skin irritation or rash occurs: Get medical advice / attention.
- P362+P364 Take off contaminated clothing and wash it before reuse.

**Disposal**
- P501 Dispose of contents / container in accordance with local regulations.

Safety Data Sheets are available at www.transfusion.abbott or contact your local representative.

For a detailed discussion of safety precautions during system operation, refer to the Alinity’s System Operations Manual, Section 8.

**Reagent Handling**
- Do not invert reagent cartridges.
- Upon receipt, reagent cartridges can be used immediately or stored in an upright position.
- If a reagent cartridge is dropped, place in an upright position for 1 hour before use to allow bubbles that may have formed to dissipate.
- Reagents are susceptible to the formation of foam and bubbles. Bubbles may interfere with the detection of the reagent level in the cartridge and cause insufficient reagent aspiration that may adversely affect results.

For a detailed discussion of reagent handling precautions during system operation, refer to the Alinity’s System Operations Manual, Section 7.

**Reagent Storage**
- Do not freeze.

</tbody>
</table>

Storage Temperature Maximum Storage Time Additional Storage Instructions
Unopened 2 to 8°C Until expiration date Store in upright position.

* Includes time on board the system.

Reagents may be stored on or off the system. If removed from the system, store reagents with new replacement caps in an upright position at 2 to 15°C. For reagents stored off the system, it is recommended that they be stored in their original trays or boxes to ensure they remain upright.

For information on unloading reagents, refer to the Alinity’s System Operations Manual, Section 5.

**Indications of Reagent Deterioration**
Deterioration of the reagents may be indicated when a calibration error occurs or a control value is out of the specified range. Associated test results are invalid, and samples must be retested. Assay recalibration may be necessary.

For troubleshooting information, refer to the Alinity’s System Operations Manual, Section 10.

**INSTRUMENT PROCEDURE**
The Alinity’s Chagas Assay File must be installed on the Alinity’s System prior to performing the assay.

For detailed information on assay file installation and viewing and editing assay parameters, refer to the Alinity’s System Operations Manual, Section 2.

For information on printing assay parameters, refer to the Alinity’s System Operations Manual, Section 5.

For a detailed description of system procedures, refer to the Alinity’s System Operations Manual.

**SPECIMEN COLLECTION AND PREPARATION FOR ANALYSIS**

**Specimen Types**
The specimen types listed below were verified for use with this assay.

Other specimen types and anticoagulants have not been verified with this assay.

---

\(^{10-13}\)
- Liquid anticoagulants may have a dilution effect resulting in lower S/CO values for individual specimens.
- Performance has not been established for the use of plasmapheresis specimens.
- Performance has not been established for the use of umbilical cord blood or bodily fluids such as urine, saliva, semen, amniotic fluid, cerebrospinal fluid, or pleural fluid.
- Performance has been established for the use of cadaveric serum specimens (including specimens collected post-mortem, non-heart-beating) that have been collected up to 24 hours after death.\textsuperscript{15,16} Follow general standards and/or regulations for non-heart-beating (or non-cardiac, non-heart-beating) that have been collected up to 24 hours after death.\textsuperscript{15,16} Specimens from patients with plasma dilution due to transfusions of > 2000 mL of blood or colloids within 48 hours, or > 2000 mL of crystalloids within 1 hour (or any combination thereof) prior to collection of the specimens has not been verified.
- The system does not provide the capability to verify specimen types. It is the responsibility of the operator to verify that the correct specimen types are used with the assay.

**Specimen Conditions**
- Do not use:
  - heat-inactivated specimens
  - pooled specimens
  - grossly hemolized specimens
  - specimens with obvious microbial contamination
  - specimens with fungal growth
- For accurate results, serum and plasma specimens should be free of fibrin, red blood cells, and other particulate matter.
- To prevent cross contamination, use of disposable pipettes or pipette tips is recommended.

**Preparation for Analysis**
Failure to follow the specified centrifugation procedure may give erroneous or inconsistent results.
- Clear, nonhemolyzed specimens should be used when possible. Specimens containing visible particulate matter may give erroneous or inconsistent test results.
- Specimens should be free of bubbles. Remove bubbles with an applicator stick before analysis. Use a new applicator stick for each specimen to prevent cross contamination.
- Prior to centrifugation, previously frozen specimens must be mixed gently and thoroughly after thawing.
- All specimens must be centrifuged between 30 000 - 75 000 g-minutes.
- All specimens must be tested or retested within 48 hours of initial centrifugation. After 48 hours, these specimens need to be recentrifuged between 30 000 - 75 000 g-minutes.

The acceptable time and force ranges that meet this criterion are listed in the table below.

<table>
<thead>
<tr>
<th>Centrifugation Time (Minutes)</th>

- Performance has not been established using cadaveric specimens stored at −20°C or colder for greater than 3 months.
- Storage at a combination of 15 to 30°C and 2 to 8°C may not exceed 14 days (inclusive of shipping time) and cannot exceed the maximum durations listed in the table above.
- Performance has not been established for cadaveric specimens that have undergone more than 6 freeze/thaw cycles.

Assay Procedure
For a detailed description of how to run an assay, refer to the Alinity s System Operations Manual, Section 5.
- Primary tubes may be on board the system for up to 10 hours.
- If using primary or aliquot tubes, refer to the Alinity s System Operations Manual, Section 4 to ensure sufficient specimen is present.
- To minimize the effects of evaporation, verify adequate sample cup volume is present prior to running the test.
- Maximum number of replicates sampled from the same sample cup: 10
  - ≤ 3 hours on the reagent and sample manager:
    - Sample volume for first test: 240 µL
    - Sample volume for each additional test from same sample cup: 40 µL
  - > 3 hours on the reagent and sample manager:
    - Replace with a fresh aliquot of sample.
- Refer to the Alinity s Chagas Calibrator Kit, Assay Control Kit, and/or Release Control Kit package inserts for preparation and usage.
- For general operating procedures, refer to the Alinity s System Operations Manual, Section 5.
- For optimal performance, it is important to perform routine maintenance as described in the Alinity s System Operations Manual, Section 9. Perform maintenance more frequently when required by laboratory procedures.

Calibration
For instructions on performing a calibration, refer to the Alinity s System Operations Manual, Section 5.
Three replicates of Alinity s Chagas Calibrator 1 are automatically tested by the system. The calibrator must be priority loaded. Each assay control must be tested to evaluate the assay calibration. Once a calibration is accepted and stored, it may be used for 14 days. During this time, all subsequent samples may be tested without further calibration unless:
- A reagent kit with a new lot number is used.
- Daily quality control results are outside of quality control limits used to monitor and control system performance.
This assay may require recalibration after maintenance to critical parts or subsystems or after service procedures have been performed.

Quality Control Procedures
Assay Controls
The Alinity s Chagas Assay Controls must be tested once every 24 hours when the system is being used. Assay control values must be within the ranges specified in the Alinity s Chagas Assay Control Kit package insert. When the assay control values are within range, sample results are generated, and a valid release control result is required to release test results. If an assay control value is not within range, sample results are not generated for in-process or scheduled samples. For troubleshooting information, refer to the Alinity s System Operations Manual, Section 10.

Release Controls
The Alinity s Chagas Release Control must be tested in order to release test results. The release control is tested at user-defined intervals. For configuring the release control, refer to the Alinity s System Operations Manual, Section 2. For manually ordering the release control, refer to the Alinity s System Operations Manual, Section 5.
The release control must meet specifications defined in the Alinity s Chagas Release Control Kit package insert in order to validate the system functionality and release test results. If the release control does not meet specifications, refer to the Alinity s System Operations Manual, Section 10, for additional information.
Other Controls
Additional controls may be tested at operator’s discretion in accordance with local, state, and/or federal regulations or accreditation requirements and your laboratory’s quality control policy. For additional information on configuring customer controls, refer to the Alinity s System Operations Manual, Section 2.

Invalidate controls: Additional controls may be tested anywhere within a run as an invalidate control. Specifications may be assigned to invalidating controls. If an invalidate control fails to meet assigned specifications, no sample results are calculated or provided by the system. When an invalidate control meets assigned specifications, sample processing continues, and a valid release control result is required to release test results.

Non-validating controls: Additional controls may be tested anywhere within a run as a non-validating control. Specifications may be assigned to non-validating controls. A valid release control result is required to release test results. If the user-assigned specifications for the non-validating control(s) are not met and the release control specifications are met, there will be no effect on sample processing. In this case, reactive sample results must not be considered invalid.

Quality Control Guidance
Refer to “Basic QC Practices” by James O Westgard, Ph.D. for guidance on laboratory quality control practices.15

RESULTS
Calculation
The Alinity s System calculates results for the Alinity s Chagas assay using the ratio of the sample RLU to the cutoff RLU (S/CO) for each specimen and control.
Cutoff RLU = Calibrator 1 Mean RLU x 0.85
The cutoff RLU is stored for each reagent lot calibration.
S/CO = Sample RLU/Cutoff RLU

Interpretation of Results
The cutoff is 1.00 S/CO.

<table>
<thead>
<tr>

</tr>
</tbody>
</table>

Supplemental methods should follow appropriate FDA recommendations and regulations for specimens found to be repeatedly reactive.

Customers outside the US must follow their country’s government recommendations and regulations for specimens found to be repeatedly reactive.

Flags
Some results may contain information in the Flags field. For a description of the flags that may appear in this field, refer to the Alinity s System Operations Manual, Section 5.

LIMITATIONS OF THE PROCEDURE
• Potential interference has not been evaluated for substances other than those described in the SPECIFIC PERFORMANCE CHARACTERISTICS - Interference section of this package insert.
• False reactive results can be expected with any test kit. Falsely elevated results may be observed due to non-specific interactions (refer to the SPECIFIC PERFORMANCE CHARACTERISTICS section of this package insert).
• Reactivity of the Alinity s Chagas assay may be observed with specimens obtained from individuals infected with Trypanosoma brucei, Leishmania, or Plasmodium vivax (refer to the SPECIFIC PERFORMANCE CHARACTERISTICS section of this package insert).
• Although the association of infectivity and the presence of antibodies to T cruzi is strong, it is recognized that presently available methods for the detection of antibodies to T cruzi are not sensitive enough to detect all potentially infectious units of blood or possible cases of T cruzi infection. A nonreactive test result does not exclude infection.

Refer to the SPECIMEN COLLECTION AND PREPARATION FOR ANALYSIS section of this package insert for specimen limitations.
SPECIFIC PERFORMANCE CHARACTERISTICS

Representative performance data are provided in this section. Results obtained in individual laboratories may vary.

Reproducibility

A study was performed based on guidance from CLSI EP15-A2. Testing was conducted using 3 lots of the Alinity s Chagas Reagent Kit, Calibrator Kit, Assay Control Kit, and Release Control Kit. Panel members and controls were tested twice a day for 5 days in replicates of 4 at 3 sites.

c One replicate was missing due to a pressure monitoring error.

Specificity

A total of 6828 fresh serum specimens and 8976 fresh plasma specimens from volunteer whole blood donors were collected at 3 distinct blood centers. The specimens were collected from donors that had not been screened on a previous donation using an FDA-licensed test for antibodies to T cruzi (i.e., first time donors). The initial and repeat reactive rates for the serum specimens were 0.09% (6/6828) and 0.09% (6/6828), respectively. The initial and repeat reactive rates for the plasma specimens were 0.04% (4/8976) and 0.04% (4/8976), respectively. Repeatedly reactive specimens were further tested using an anti-T cruzi supplemental assay. Based on supplemental test results, 3 specimens were positive, 3 specimens were negative, and 4 specimens were indeterminate.

Specificity based on assumed zero prevalence of antibody to T cruzi in whole blood donors was estimated in this study to be 99.98% (15 787/15 790) with a 95% confidence interval of 99.94% to 100.00%.

RR = Repeatedly Reactive; CI = Confidence Interval

a Preselected T cruzi parasite positive specimens were determined by historical diagnosis (xenodiagnosis or hemoculture) or prospective xenodiagnosis.

b Preselected T cruzi serology positive specimens were determined to have T cruzi antibody by 2 different serological tests. Specimens were obtained from South America (85), Mexico (9) and the United States (114).
An additional 615 specimens from individuals from Chagas endemic areas were tested using the Alinity’s Chagas assay and a commercially available anti-T cruzi assay at 3 clinical sites.

The effect of potentially interfering substances has only been evaluated for those listed in this package insert. In addition, a negative and positive control were spiked with biotin to a concentration of 4250 ng/mL. No interference was observed using the Alinity’s Chagas assay.

Other Specimen Conditions or Disease States

A total of 256 specimens from individuals with other specimen conditions or disease states unrelated to T cruzi infection were evaluated. Of the 256 specimens, 13 were repeatedly reactive using the Alinity’s Chagas assay and positive by supplemental testing.

Interference

Potentially Interfering Endogenous Substances

A study was performed based on guidance from CLSI EP07-A2.17 No interference was observed using the Alinity’s Chagas assay from potentially interfering substances at the levels shown below.

In addition, a negative and positive control were spiked with biotin to a concentration of 4250 ng/mL. No interference was observed using the Alinity’s Chagas assay. The effect of potentially interfering substances has only been evaluated for those listed in this package insert.

### PERFORMANCE CHARACTERISTICS OF CADAVERIC SPECIMEN TESTING

Reproducibility

Twenty-three cadaveric donor serum specimens and 23 living donor serum specimens were spiked with human plasma reactive for antibodies to T cruzi to create low-level reactive specimens. Each specimen was tested once per day for 6 days using each of 3 lots of the Alinity’s Chagas Reagent Kit. Total %CV values were determined.

CI = Confidence Interval

<sup>a</sup> Cadaveric specimens were collected up to 10.0 hours after death.

Specificity

Specificity was determined by testing 55 cadaveric serum specimens and 55 living donor serum specimens. Each specimen was tested once using each of 3 lots of the Alinity’s Chagas Reagent Kit.

Analytical Sensitivity

Cadaveric serum specimens and living donor serum specimens were spiked with human plasma reactive for antibodies to T cruzi to create low-level reactive specimens. Each specimen was tested once, within 24 hours of spiking, using each of 3 lots of the Alinity’s Chagas Reagent Kit. All specimens were reactive on all 3 reagent lots.

CI = Confidence Interval

<sup>a</sup> Cadaveric serum specimens were collected up to 23.7 hours after death.
Cadaveric Specimen Storage

Cadaveric specimen storage was determined by testing a minimum of 12 low-level reactive specimens, prepared by spiking nonreactive cadaveric serum specimens to a target S/CO value near the cutoff with human plasma reactive for anti-\textit{T. cruzi}, and a minimum of 12 nonreactive cadaveric serum specimens. Each specimen was tested at Day 0, and then subjected to either 2 to 8°C storage for 14 days, room temperature (15 to 30°C) storage for 3 days, −20°C or colder storage for 3 months, or 6 freeze/thaw cycles. Nonreactive specimens were evaluated by calculating the differences between the mean S/CO of Day 0 and the mean S/CO of each storage condition and related timepoint. Reactive specimens were evaluated by calculating the percent differences between the mean S/CO of Day 0 and the mean S/CO of each storage condition and related timepoint. There were no changes to the interpretation; the data demonstrate that cadaveric serum specimens can be stored at the following conditions when tested using the Alinity s Chagas assay.

CI = Confidence Interval

a Cadaveric serum specimens were collected up to 41.8 hours after death.

b Cadaveric serum specimens were collected up to 14.5 hours after death.

### BIBLIOGRAPHY

### Note for number formatting:

- A space is used as thousands separator (example: 10 000 specimens).
- A period is used to separate the integer part from the fractional part of a number written in decimal form (example: 3.12%).
